WE present, in this work, a new typology of thinking Residential House. Instead of thinking a sustainable concept based on an year scale, we assumed new character in a **DAY SCALE**.

Buildings change their conformation from morning to the night, **appearing to catch the light, disappearing to sleep in peace.** Elevators with ordinary pulley systems permit respective inhabitants to reach different floors, from the basement to the roof.

Rooms are placed in the lower floors and daylight function in the upper ones. **Kitchen and Library move up and down adding a function to the elevators.**
